AMD's 30x25 Goal

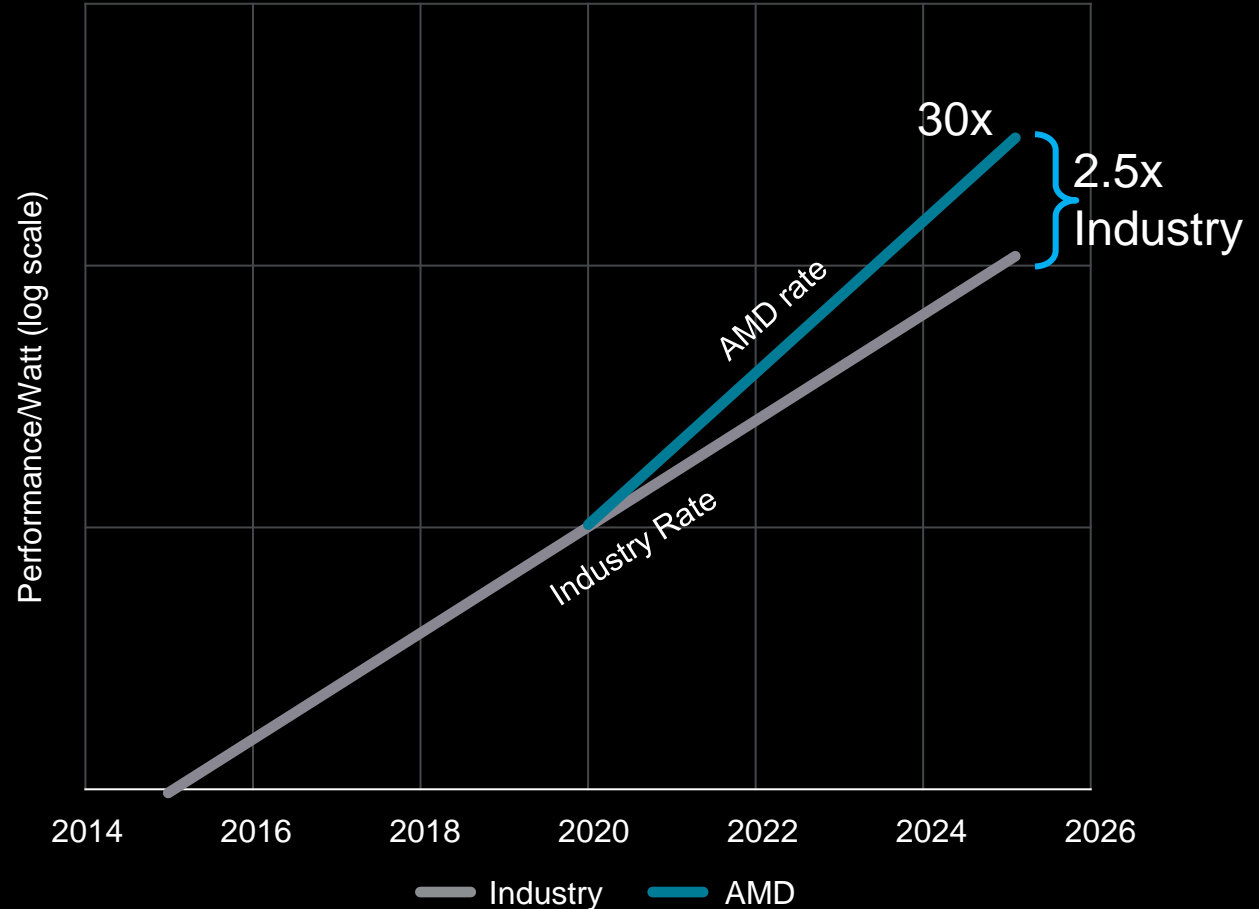

30x increase in energy efficiency for AMD processors and accelerators from 2020-2025*

- Focus on Accelerated Computing nodes using AMD CPUs and GPUs

- Exploit architectural innovations, package and silicon technology advances to change the trend

Accelerated Computing Performance/Watt Trends

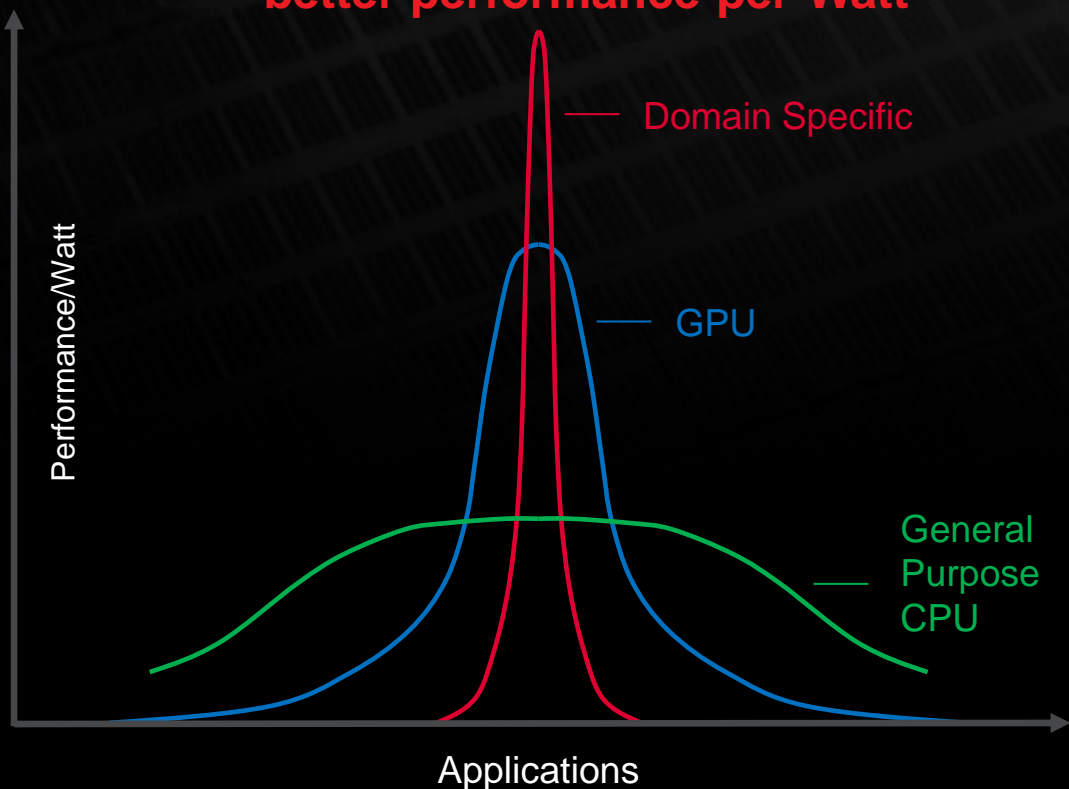

Based on 2015-2020 industry trends in energy efficiency gains and data center energy consumption in 2025.

* Includes AMD high performance CPU and GPU accelerators used for AI training and High-Performance Computing in a 4-Accelerator, CPU hosted configuration. Goal calculations are based on performance scores as measured by standard performance metrics (HPC: Linpack DGEMM kernel FLOPS with 4k matrix size. AI training: lower precision training-focused floating point math GEMM kernels such as FP16 or BF16 FLOPS operating on 4k matrices) divided by the rated power consumption of a representative accelerated compute node including the CPU host + memory, and 4 GPU accelerators.

Efficiency through Domain Specific Architectures and Package Innovation

Application-Specific optimization provides better performance-per-Watt

AMD is leading the way in finding new approaches to reduce energy for compute

Modular design, chiplets, and 3D stacking are the next frontier for efficiency gains

CHIPLETS

3D CHIPLETS

(Chiplet + Advanced 3D Stacking)

2025 → 2030

Further application-specific acceleration

Even more advanced packaging and integration

3D Chiplets

Next Era for Chiplets

(Chiplet + Advanced 3D Stacking)

(Multiple combinations of 2D and 3D)

Software and Co-design critical to achieve 1000x

Thank You!
